Brewin - January 17, 2017, 11:54 am

Trippy! A lot of those I swear I remember, pretty cool though!

Ikr, apparently a lot of other people also remember.

(Jan 17, 2017 12:58 PM)BlizzarDesigns Wrote: [\[CITE\]](#) Ikr, apparently a lot of other people also remember.

I've looked into the Mandela code quite a bit. Apparently, it's because the brain doesn't see the small detail as anything important, thus they don't remember.

Personally, I agree with this. However, as the brain is almost being challenged, it fabricates the memory so that it believe its right. The brain doesn't like being wrong, and when someone claims to remember something differently, asking if you noticed this small change that was (apparently) once there, it wants to say that it can remember.

I don't feel as though this explains it very well. I'll try again if you didn't understand (it's my bad)

Basically, you know which it is. You're so used to it that you don't notice or remember noticing this small detail. If at any point someone's brain trips out for a second, such as the beginning of mental disorders, they become convinced that they are right. This is because the brain wants to be right.

When they post this somewhere, showing it to the public, the readers begin to doubt what they already know. This small detail could've been there and it could not have. This person remembers it as this, but it is no longer this way- the brain thinks it is being tricked, lied to.

To fight it (such as how we instinctively fight small change, in government or our environment for example, and how we fight those whom lie to us) we convince ourselves that we and our brains know best. It becomes our relativity such as a person with dementia has an altered reality- this is just a dememented reality, a part of our brains not working properly. It's similar to those whom believe aliens are amongst us, or how the illuminati control the world (I'm not trying to take those theories apart, it's just an example). A group of people believe they have remembered something that used to be how it was, in an attempt to believe we are in control of what happens, our brains and our environments.

Once you've seen it, you'll remember and believe it.

I am open to the possibility that these mandela effects are false memories, but to the same extent as I am open to the possibility that they are not false. To rule out that they were ever changed, all of these logo's were never changed from the ones on the left to the ones on the right. I made the logo's on the left (excluding 2 of them), and they never existed (someone also made a frebreeze edit too). If they did exist(at any point in time), I would have just copy pasted the existing ones, however the logo's were always the way they are on the right.

Secondly, If my memory is bad, there would not be residual evidence left over. For example, I have remixes of a song called Jack U- Febreze, except these remixes are still titled "febreeze", as they used to be. Additionally, there is no way everyone's false memory is so identical that they even get the same nostalgia from these memories, in such starkly close timelines. Not to mention, you can yourself ask anyone you know what color chartreuse is and they will tell you what it was. As to the coincidental nature of this effect, confirmation bias could have played a role. But the justifying evidence is the residual clues such as the photograph of the lion and lamb, which is famous. I think doubting your own memory is a huge step in the wrong direction if you want to avoid mental illness, and the only rational way to deal with a paradox like this is to entertain the idea without precedent in regards to mental conditions and self doubt.

The proof is in the nostalgia, and in this case, if the mandela effect is legitimate, that means that reality is a variable and memory is the only real constant. This quote can serve to illustrate this idea:

"He who controls the past controls the future. He who controls the present controls the past."

- George Orwell, 1984

Delving deep enough into this subject could obviously induce mental illness in anyone, but so could any undertaking of the unknown.

Lante - January 17, 2017, 12:20 pm

Thanks for the share, I apparently didn't realize some logos changed, I do remember the left side for most, but at the same time know the right ones as well.

??GY - January 17, 2017, 12:32 pm

You made those? See, by looking at them, I couldn't tell old from new.
That's fucked

I wouldn't say that it's nostalgia, as that is the reason, in most cases, for blindly fighting for something to be better than another, new thing- but not a different thing.

They're similar, as nostalgia is remembering something that was there, believing that it was beautiful, good, or better than the present. Your brain wants it to be that way so that the good memories remain valid, but it isn't Mandela (in my opinion)

Mandela is remembering something that didn't exist st all. Nostalgia is truth, a truth that is no longer valid (due to change) which you still want to be true (and you swear that it is.). Marbella would be a lie, something that is so small, such as a minor edit on a logo, that it (in your mind) becomes a truth.

That's just my opinion, though. The points in the thread are rhetorical, as if we were talking about ghosts being real or something. As if we were talking about 7 people who are supposed to meet for some purpose.

Or something like that.

I completely ageee wth 'exploring' these without letting it affect your mental. It's fun! I do the same thing, but I get a little bit sucked into it from time to time.

BTW have you uncovered and explored 'the ***** code yet?' There is no way to forget, you must progress to the end ooOOooooooOooHhhHh hahah

hurt. - January 17, 2017, 9:28 pm

this is trippy af dude, been seeing all kinds of mandela effect things lately and they freak me out i remember things so much differently lmaoo its crazy

Wakka - January 17, 2017, 9:34 pm

CP30 Has a silver foot apparently, that freaked me out the most.

Obimoto - January 17, 2017, 9:38 pm

Our memory gets fucked up all the time...

It's kinda sad realizing that people are so narcissistic and/or naive that they need to make up an elaborate effect such as this, instead of admitting their brain was wrong about some insignificant details...

nope lmao, it's real. The reason some people don't remember is because those people, were always from the orion constellation that we are now in. I, among millions of people remember clearly that we were in Sagittarius constellation, not orion. I don't know where this random doubt began, about memory, but false memory has been ruled out time and time again. One way it was ruled out was by the analytics of google searches in 2014-15 in relation to the old mandela effected spelling of words.

But the Orion was to be found before. How could we be there if it is lost?

Are you being purposely stupid, or do I need to explain how you have the burden of proof for making a positive claim???

My statement is, "I cannot believe this until sufficient evidence is brought forth..."

Since you have no actual evidence, this claim you are making is unbelievable...

Well I was being sarcastic, which I guess is being purposely stupid.

Since this situation is particularly abstract in relation to evidence and proof I cannot provide anything further then what memory serves to propose as being true, via the validating nature of nostalgia. When a collective nostalgia is restricted to a certain time-frame it becomes an anomaly in the field of false memories. So no, there is no "actual evidence" other then what could be concluded from the residual leftovers. There seems to be the same amount of residual memory as residual images/leftovers. However, I am not in the place to make any conclusions regarding this matter because I, like anybody else do not know for sure. Some people do claim to know for certain, and are willing to provide you with "proof" given that you are willing to entertain it's potential for being valid.

KingCoin - January 18, 2017, 2:55 pm

Interesting shit bro

good thread

Obimoto - January 18, 2017, 4:30 pm

Huh, I actually like this guy...

I have nothing to complain about since you are humbly willing to admit that you have no evidence for me, and I respect you for how you handle conversations such as this one...

I'm absolutely always willing to entertain an idea, so if anyone wants to provide me with such, I will attentively listen (although, I cannot promise that I will be convinced)...
