Thread: [Do you think we have privacy?](#)

Vittorio - January 18, 2017, 10:04 pm

Worries have been happening about people and their privacy. Some say the government have the right to monitor what we do while others say they don't have the right. Privacy over the years has been becoming less private and more open for your information to be shared. Many question how safe are you while using the internet. Almost all type of programs and softwares along with websites have a term and conditions while using them. These terms and conditions could state that your private information will and could be shared to third party people giving your information for them to market based off of it. Privacy is breached within everywhere on the internet many sites may breach your information without you even knowing. Most individuals don't care if their privacy is being breached but some may not agree with this. The government seems to be a major privacy bypassers, many programs are designated in order to track people and go through all their information. An ex-cia operative by the name of Edward Snowden revealed the government's plans of them spying on us. NSA is a group designated to track people and go through their emails and see their everyday behavior. Hackers is a nickname given to people who go on the internet and steal information from people who browse around websites, this could involve in them stealing credits whenever they make payments. Drones are another seemed as a privacy problem. Drones are flying devices with cameras equipped that could lead to troubles to those who believe they could be spied on with these. Overall there are very many ways for your privacy to become bypassed and no longer surf with privacy, this could be very troublesome towards the individuals who believe their privacy should be private and not just given to these public websites used as third party marketing. Not to be afraid many ways are possible to make sure your privacy is to be secured and not just be giving out to the public

TL:DR: were not really private

Tid?es - January 18, 2017, 10:05 pm

Of course we're not private. The downside to having a smarthome is knowing that somewhere out there everything you are saying is being recorded. It doesn't bother me though, I have nothing to hide.
