Thread: [Site clone](#)

Nellone93 - January 19, 2017, 2:47 am

Hello, i'd like to use backtrack to clone a site like fb, once i cloned the site, which link have i to send to the victim to show me his credential?

BackTrack? What year are you living in, unless it's still developed on which I doubt it is- it's pretty outdated; I wouldn't use it opposed to something like Kali.

redlightrouter - January 19, 2017, 1:27 pm

Ehh.. 2013 called, they want their pentesting distro back. Bad joke, I know. You could use SEToolkit.

Directory_ - January 19, 2017, 1:37 pm

Use Kali Linux, then Social Engineering Toolkit

Aveling - January 19, 2017, 1:40 pm

I just want to state the obvious, you can't 100% clone a website, what you can clone what your browser displays, there is no way that you can clone the PHP scripts or other server-side scripts.

This means that if you cloned a website with a login, you will be able to use the login because it relies on the PHP scripts.

Please correct me if I am wrong though. There is always a possibility..
