Thread: [Wait for Program to finish in Commandline?](#)

Haters Ganna Hate - January 20, 2017, 8:50 am

I want my program to do a command in the commandline, then wait till that command finishes and it jumps back to CMD asking for the next command.

How would I do that?

Annabelle Lee - January 20, 2017, 9:14 am

Well in order to create a command line and execute a command in it, you can try using Process.Start.

yup what he said, if i recall the process class has this method that would block the current thread until it was exited.

```
Code dim p as process = Process.Start("path\to\app.ex")
p.WaitForExit()
```

I might be wrong but this should be it

You should have a second argument to it, which will be the commands to run.

```
Code Process.Start("path\to\app.exe", "command here")
```
