Thread: [\[Web Proxy\] Overacity Proxy Sites](#)

allhellno - January 25, 2017, 5:37 am

This is an update to my previous thread <https://hackforums.net/showthread.php?tid=5497423>
I currently host a web proxy services that I offer for free (stuffed full of ads).

<https://www.overacity.com/>

<https://www.buythebay.org/>

<https://www.verydeep.org/>

My current setup is two ESXi 6.0 servers running 1 pfSense VoE (virtual operating environment) and 1 CentOS 7 VoE each. The pfSense VoEs each have a /30 and a /28 public subnet assigned. The /30 subnets are dedicated strictly to the pfSense VoEs and the /28 subnets are NAT'd to the backend CentOS 7 VoEs, except ports 80 and 443 which pfSense handles.

The frontends which are running on the pfSense VoEs are utilizing [haproxy loadbalancer software](#) running in least-connection mode balancing between 26 instances of CGIProxy running on the backend VoEs. The backends are running heavily modified versions of [CGIProxy](#) in embedded daemon mode.

If you have any questions/suggestions please share them here, thanks.
