This will be one of my first contribution to this forums, hope it can be usefull in some sort.
Today i won't make a tutorial, just leave some tips

I've had a bit of experience with Loggers, stealers and rats.
But i always get a lot of useless crap that doesnt suit me, or used to xD

One easy way i found out to select what kind of slaves/logs you get, depends on what do you crypt/bind it to

Ex:. You just set up your new Stealer and want to grab some Steam Acc's With specific games in it and all you get is Dota or Minecraft, well.

1° - Hacks are a great way to get slaves/logs
Lets say you want a steam with Arma or Counter Strike ?

Grab a free release of Aimbot or a Macro for THE GAME YOU WANT, bind your server to it, spread it. Some noob kid will download it for sure and you get his data.

2° -If You're into bitcoin, banking, Disguise it as a new Wallet, or a Bitcoin Gambler (This is better than faucet bot, cuz if people go to a faucet for free little microcoins, there won't be enough for you

3° - Paypal, Amazon, Ebay Etc, a great way of getting this info is by Phishing. (Might Make a Detailed Tut)

EDIT - ITS AGAINST THE RULES HERE TO PHISH ..so i removed that section

4° - During the actual search, always use VPN matching victim's IP Location, this will prevent security flags, and most of the times you will bypass those sistems

5° - Have something interesting but cant log into it ? Set your DB filter to that person's IP, or Computer name, see all entries for that specific person, often times you're stuck with 1 password, but the user may have updated it to another one, that you might also have

6° - Search through Facebook, Google that person's nickname, Gather social info before you attack, you might need a birth date, phone number, momma's name for a security question or just be a creep and check his GF naked pics on his fb chat kk whatever

7° - PATIENCE IS KEY ! Christmas only comes 1 time per year, not everyday. Never back down ! Success comes from failed attempts

I've learned this through experience, through failing, all i can say is, with those tips you'll have a higher chance of getting what you need, like i did

I know its not much, its all i can think for now. Hope it was helpful to someone

Thanks for the pointers but would it be possible to mentor me step by step? in fauceting bitcoin?

Log crawling its all about preperation, and ability to think, Gather as much as you can b4 you attempt to change anything, Get E-mail, check the recovery E-mails for that one, Grab facebook, twitter, forums accounts, search through e-mail for registering messages (some may contain username and pw) Basically try to know the person b4 you try to grab them accounts

Keep it smart - You might wanna check the Social Engineering section, I had hacks where i had to speak to the person itself to get some info, pretending i was support, others you have to play along, create a Facebook profile with some Hot girl pics, go talk to him, hello baby etc... so u have a dog ? what's his name ? Bamm .. thats the Dog's Name security answer done

Make it look natural and legit
