Thread: [Does SQL Injection in a subdomain allow takeover of main site?](#)

8220347 - January 28, 2017, 7:33 am

Say I find a sql injection vulnerability in subdomain.test.com. Would this give me access to information of users on test.com (logins), or just subdomain.test.com? Thanks

xx 0x0 xx - January 28, 2017, 1:04 pm

there are many cases

- 1-) this subdomain database is the same as test.com // then u can get the same database
- 2-) subdomain on the same server but not same database // this will require shell/root the server
- 3-) subdomain on other server with stand alone database // this is no you can't u will just get subdomain.test.com database

If they have the same IP, there is a chance.

Are the majority of sites configured with the "subdomain database the same as test.com" or are most configured with "subdomain on other server with stand alone database"

i think most of web masters configure it as stand alone on other servers

This, but they're often shared servers, so it's possible to get access to other user's sites on the server.

Often websites like to use the same database site wide, so yes. You will have access to the database of test.com

Cheers ?

Yes You Will Have Access to The Database ... Some Time
