Thread: [Need some definition of keylogger terms](#)

jessicatight - January 29, 2017, 9:00 am

Hey people I am not sure of the name or it might go by many different names. I see the word "recovery", "stealer", and a couple of others.

What I am looking for is when someone enters a website and logs in with their username and password and not save it to their browser for later use. If they hit the backspace I don't want it to read register.

Lets take a "username" as the username. If the person types in the username box userm backspace name. I don't want the log to register the mistake of "m" and then backspace "n". Once they click submit I want the word "username" to appear.

What would this be called, because I assume "recovery" is not what I am looking for. Correct me if I am wrong.

You definitely need a keylogger. I could tell you that he/she is only safe from you, if they Save them and Protect the passwordslist with AES256. Happy decrypt.

So years ago i saw some keyloggers who do that simple thing, when victims making mistakes, when you read the log you will see something like hellp{BS}o So its easier to code.

haha something like that, so he is not really doin much. but you can see that he has done a mistake
