Thread: [Crypting corrupts my file](#)

Kisame? - January 30, 2017, 12:18 pm

Hello,

I am trying to crypt a specific file (won't specify it any more on here ?).

However, each time I encrypt it, the file gets corrupted and doesn't function anymore.

I know the crypters I use are fine. I use static for example and it always gives me perfect outcomes with low/non existing detection rates. Also it doesn't corrupt for example, my Luminosity stub.

The file I am trying to crypt is a native file, and I am using "itself"-injection together with XOR-encryption. The crypting goes fine and the detections lower, however the file gets rendered completely useless afterwards. I am pretty sure it's a native file, considering the crypter says it is and the function hasn't ever failed me before.

If someone could help me crypting this, it'd be appreciated. Even if I turn off all the features in my crypter and just use XOR encryption, it will still ruin my stub (maybe because of the injection part, I have no idea to be honest).

I crypted the same file with an XOR encryption script (just a regular script, obviously doesn't lower the detection rate enough to be usable).

Thanks in advance for your help.

Maybe need's EOF?!???

That's a good suggestion, thank you. That might be causing it.

Static crypt doesn't have that function, though.

Does anyone here own a crypter with an EOF feature who is willing to crypt a file for me to test whether EOF is the reason of my corrupt crypts?

Maybe I can do this, let me know. (just test, isn't FUD)
