Thread: [\[Notorious\] Official Help Desk / Post your questions / General RAT Help & Support](#)

bzr? - February 2, 2017, 1:02 pm

Notorious - RAT Helpdesk

Turn your face to the sun and the shadows fall behind you.

Welcome to the Notorious helpdesk.

Having a problem with your RAT? Need some extra support?

We're here to help.

Our support members:

[bzk](#)

[Armada](#)

[Alexishay](#)

[JaGLY](#)

[RAT Support](#)

If you're just starting out, you're in the right place. Below you'll find the most reliable current offerings, paid and free.

Reliable RAT(s) (free):

njRAT - .Net 2.0 - [Download](#)

Babylon - Native - [Download](#)

Quasar - .Net 4.0 (open-source) - [GitHub](#)

Reliable RAT(s) (paid):

Imminent Monitor - starting at \$25 (1 license) - [Thread link](#)

LuminosityLink Workstation - \$40 (1 license) - [Thread link](#)

Orcus Remote Administrator - \$40 (1 license) [Thread link](#)

Reliable VPN solutions:

Cryptic VPN - starting at \$.99 (1 day) - [Thread link](#)

PhyberVPN - starting at \$.70 (1 day) - [Thread link](#)

Reliable DNS Solutions (free)

Dynu - free (includes Windows client) - [Website link](#)

Reliable DNS Solutions (paid)

Armada's Secure DNS Service - starting at \$30 (1 year) - [Thread link](#)

NameCheap - starting at \$.99 (1 year) - [Website link](#)

Reliable crypter solutions:

CyberSeal - starting at \$40 (3 months) - [Thread link](#)

Static Crypt - \$30 (45 days) - [Thread link](#)

DataProtector - starting at \$35.50 (45 days) - [Thread Link](#)

Reliable crypter solutions for Java RATs:

jFuzzle - Starting at \$13.99 (31 days) - [Thread Link](#)

Reliable scanning solutions:

pscan.xyz - free - No Distribution - [Website link](#)

Majyx Scanner - free - No Distribution - [Website link](#)

Chk4Run - Runtime scan detection - Paid (starting at \$5/day or 0.002 BTC / ~\$2 per scan) - [Thread Link](#)

Useful threads by members of Notorious

Hey, so I currently have IM, with Cyber Seal along side armada's DNS service. I've been able to create a few stubs, finally got a final product after some settings tinkering, but seems whenever I do test installs the client doesn't come in through IM. I have the ports listening, and forwarded. I am unsure what my issue is. Any help is appreciated. :D

Purple Kief - February 2, 2017, 6:20 pm

Did you ever test the client locally? And if you ping your DNS in cmd does the correct IP come back?

Koopa. - February 3, 2017, 9:47 am

Vouch for OP's. Purple Kief's, and Armada's knowledge in this this topic. They are also very friendly and helpful.

(Feb 3, 2017 05:46 AM)??zrK Wrote: [\[CITE\]](#) Did you ever test the client locally? And if you ping your DNS in cmd does the correct IP come back?

As both noted before hand, the first test is to determine how and where your problem is happening.

My first course of action, as the others are attempting to determine is how and where your routing is going wrong.

If you utilize my DNS service, the DNS instructions are straight forward.

Update using the site with your credentials and the new IP#.

Assuming when you PING your host name it pings to the IP# you have pointed it to that portion is considered RESOLVED.

Plese read and follow the following from my RAT 101 guide.

(Sep 18, 2015 11:25 PM)Armada Wrote: [\[CITE\]](#)

Introduction:

When we discuss Networking and Network topologies on a Remote Administration and associated technology level. A new array of problems and configuration concerns must not only be met, but also carefully configured to not compromise security to the designated user. This being said, we need to look at and approach networking in a different perspective to start. Where most users when they begin in the network security field believe they already have a good understanding of basic networking because they can hook up a cable modem and wireless router without issue. Remote Administrative tools require special and unique network configurations to ensure correct and proper communication.

The Basics, without being so basic.

Spoiler ([Click to View](#))

Figure 1 – 2 Computers in Communication.

In this model we have the simplest figure of computer networking. 2 machines in direct communication using a form of networking protocol (Likely IPv4 or IPv6). In this model the computers are shown with no protective measures, firewalls or anti-virus/security protection software elements in place. – A scenario now a days which is highly unlikely.

Figure 2 – 2 Computers in Communication with Firewall/Security in Place.

In Figure 2 we examine a more likely scenario where a computer has running security provisions in place. – In this example a firewall is in place on machine #1 – This scenario allows for machine #1 to accept requested information, send information outbound, however restrict unauthorized

communication from machine #2, or other machines which may attempt communication.

Understanding your networks security provisions will greatly reduce troubleshooting of connectivity problems later on.

Every layer in the network has the potential to have another form of network security in place. It is highly recommended before attempting to start use of Remote Administrative tools the user sit down and plan the networks design and strategy out beforehand. Use of Microsoft Visio is a fantastic resource for such network planning.

Figure 3 – A Typical Home Network Design

In Figure 3 we have a Typical Home Network design, with common elements of network connectivity. A Cable Modem (Or DSL) which provides the network gateway and hardware interface for the communication. The Wireless Router which provides resource sharing of the modems internet connectivity, and the various devices used to access the network.

However, there are hidden or less known layers which also exist within even the simplest of networks such as detailed in figure 3.

Figure 4 – Detailed Typical Home Network Design

In Figure 4 we examine a more detailed, but “same” network configuration. Just with a more accurate view of possible network boundaries.

Each device presents its own unique security boundaries and configurations. Workstation and Laptop terminals employ software/OS firewall security and likely Anti-viral software. Network peripherals such as Routers and Modems (or Combo devices) also present firewalls which are hardware based and accessed through the devices interface (Likely a web browser accessible configuration page). Each and Every device and security measure along the network path/route from the Internet WAN to the device being used by the user to access such Remote Administrative tasks MUST BE CORRECTLY configured to allow the network traffic to pass. In more complex networks, this can become especially tricky for some users if they do not have the correct network privileges or rights to modify the required settings.

Network Exercise:

Spoiler ([Click to View](#))

Creating a basic network flow/layout.

Users are encouraged to sit down, and record each and every device connecting their network together. This includes finding the make and model of every network peripheral included.

Although this varies from ISP and network configuration greatly, it is in general safe to assume a user with High speed internet will have the following:

Cable Modem: (Make/Model)

Wireless/Wired Router: (Make/Model)

Various Terminals/Computers: (Make/Model/OS Version/Security In Place)

Record each devices model and serial and find on the manufacturers website is that devices model enforces security measures.

For Modems and Routers firewall configurations are essential to PORT FORWARDING.

Routers being the general devices to provide resource sharing across a network will be the Default

Gateway for most devices (and thus easily accessed by using gateways IP# in the browser to access the configuration page) It is important to understand that every devices layout and options will vary to a degree from model to model. So it is highly recommended to sit down, record your settings for each device and familiarize yourself with the configurations layout and settings pages are, and where features are located.

Finding your default gateway:

In Windows Navigate to your Command Prompt

Start > Run > type "cmd"

In Command Prompt type "ipconfig". The user will be prompted with a similar dialog reply:

```
C:\>ipconfig
```

Windows IP Configuration

Wireless LAN adapter Wi-Fi:

Connection-specific DNS Suffix . : Home

Link-local IPv6 Address :

IPv4 Address. : 192.168.1.50

Subnet Mask : 255.255.255.0

Default Gateway : 192.168.1.1

The listed Default Gateway will likely be your internal Routers IP#. And also the network address in which the Routers configuration page and settings can be accessed (Through web browser interface).

// End Exercise

Port Forwarding:

Spoiler ([Click to View](#))

Majority of times more than others, the usual reason for a RAT failing to "work correctly" with new users is incorrect port forwarding rules. Without going in to too much detail, the simplest way to explain port forwarding is, within the network a user generally has 2 IP#'s. One Internet based IP# (Which is the users physical address on the internet) and a local LAN IP# (usually named 192.168.*.* or similar depending on router model.) When a user opens a port for external network communication from the internet, the port must then be pointed to the correct Local Area Network IP# (The 192.168.*.*) For this reason a user who is dealing with port forwarding is recommended to make the machines local IP# static to it does not change within the local area network, and prevents further problems with port forwarding.

This can be accomplished by accessing the Local area connection in the Control Panel of Windows > Network and Sharing Section > Change Adapter Settings.

Right clicking on the active adapter and selecting Properties > Internet Protocol version 4 > Properties.

"Use the following IP address"

- Specify a valid local subnet IP# (I recommend something like 192.168.1.121, .121 as it is high enough in the IP# pool to not be assigned on a regular basis by dynamically addressed devices.)

Subnet mask can almost always be left as the default.

Default Gateway is the Routers IP#. (If you are a 192.168.1. IP#, Router is usually 192.168.1.1)

Primary DNS server is ALSO the routers IP#.

- If configuration does not work, or internet connectivity is lost after attempting these steps, reassign IP# to "Obtain IP address automatically" to restore connectivity.

Verification of active R.A.T. port:

A simple way to verify the service has been executed successfully on the machine to be the slave is to run the netstat command from the terminals command line and look for the defined port in the listing.

Local Address - Is the local loopback (127.0.0.1 and the port number active from obviously, the local machine.

Foreign Address - Is the remote machine in which the connection is taking place with. (Command and Control, for example)

If you do not actively see the R.A.T.s defined port either communicating out, or alternatively (Command and Control Side) actively listening on the port, communication between client and server will fail.

Router Configuration for Port Forwarding:

Spoiler ([Click to View](#))

Router configurations vary in layout, but all routers contain a feature for "Port Forwarding". This is where you can tell the routers hardware firewall to allow remote connectivity in to your network. This is essential for ANY R.A.T. or software with "Call home" functionality. Within the routers configuration you must locate the Port forwarding section and add an exception for the Port number you assigned in your R.A.T.s configuration. This port must then be forwarded to a local IP# within your network (The workstations IP# you will be using the command and control from)

[align=center]RAT101 1.1 - v.1

If this is a continuous problem, please send back ALL results you have for further trouble shooting.

Nutrition - February 3, 2017, 11:54 am

127.0.0.1 is your local IP and useless in the real world. You need to perform the same test but using your dns or external IP that you use when RAtIng.

Nutrition - February 3, 2017, 6:57 pm

(Feb 3, 2017 05:54 PM)??zrK Wrote: [\[CITE\]](#) 127.0.0.1 is your local IP and useless in the real world. You need to perform the same test but using your dns or external IP that you use when RAtIng.

Yes, obviously..I ping the dns, that is the return. I figured the local IP should instead be the port forwarded VPN IP.

bzr? - February 3, 2017, 7:08 pm

(Feb 3, 2017 07:57 PM)Nutrition Wrote: [\[CITE\]](#) Yes, obviously..I ping the dns, that is the return. I figured the local IP should instead be the port forwarded VPN IP.

Well if you're pinging the DNS and that's the return, you've setup your DNS settings incorrectly, you need to go back and double check on that front.

Nutrition - February 3, 2017, 7:17 pm

Minimum = 0ms, Maximum = 0ms, Average = 0ms"

No that most definitely is not right.

So, understanding your FLOW of connectivity is critical here.

From your RAT controller (Does not matter which one either) you input the DNS host address to your Binary configuration.

Crypt, do whatever else you want with the binary, but BEFORE doing that.
Follow these steps.

The flow of RAT network (For DNS and VPN routing)

{YOUR CONTROLLER} <> {ROUTER} <> {INTERNET} <> {VPN} < {DNS}

<> = 2 way connectivity

< = 1 way connectivity

So in this model, the first 3 are handled by connecting to your VPN service.
Let's assume Cryptic VPN.

From your VPN connection you go in to the VPN CP and open your ports to the VPN internally assigned IP# (ipconfig and the IP is usually something like 10.8.*.*)

Forward your designated ports, and then go get your external VPN IP# from whatismyip.com while connected to the VPN and THEN route your DNS to the VPN IP#.

Enable your controller to listen on the port and do the standard port testing at canyouseeme.org

If all of that checks out, the port reports open and successful and you are in fact able to ping the correct IP# off of the Host name, you then turn focus to the binary.

Using a VM or external system of some kind, execute the NON crypted/ non manipulated binary on the machine and check for Binary/Client check in.

If that is successful, then proceed to crypting. If that fails, you need to go back and re-analyze all the variables.

Networking can be tricky AF, especially when we add on layer and layer of it on top of one another.

20+ years ago, Use of RATs was simpler, we did not use DNS or VPNs, just input our static IP# and the rest did the work.

Now security and internet and network spying has forced even the most legitimate of networking to be secured, encrypted and routed in much more complex methods.

It is unfortunate, but a fact of modern technology.

7 - February 4, 2017, 5:02 am

Good luck with this guys, but how come Orcus isn't up as a recommended paid rat considering Armada is on the team.

All these guys are great people other than Purple Kief who is an arrogant fuck boi..

But to the rest of you good luck and great service

bzr? - February 4, 2017, 5:58 am

(Feb 4, 2017 06:02 AM)NulldB Wrote: [\[CITE\]](#) Good luck with this guys, but how come Orcus isn't up as a recommended paid rat considering Armada is on the team.

I love Orcus, but it isn't as beginner friendly as the two I've mentioned, I might add it in as a rat for people with more experience, we'll see.

Kodaz - February 4, 2017, 6:00 am

Vouch for this :)

Great work Notorious.

bzr? - February 4, 2017, 6:58 am

(Feb 4, 2017 07:00 AM)Kodaz Wrote: [\[CITE\]](#) Vouch for this :)

Great work Notorious.

Thanks.

Lil' update, added a couple more options for RAT's in the OP.

[+] Quasar RAT

[+] Orcus RAT

Any questions shoot.

Just gonna quickly add in some personal opinions here -- My personal favourite is Orcus, for many reasons, but honestly, all the RAT's currently on offer around here are great, and I'd include them all if I could, but 1) That wouldn't make it any easier for people choosing their tools, which is one aim of this thread and 2) The reason NanoCore isn't included is because I have never personally used it so despite all the good feedback I have heard about it I can't honestly recommend it to people on my behalf.

Purple Kief - February 4, 2017, 10:53 am

(Feb 4, 2017 07:58 AM)??zrK Wrote: [\[CITE\]](#) snip

You should mention the advanced setup of Orcus on the thread.

People that come to this thread generally won't know how to set up a RAT. Orcus is way out of the league. ?

Armada - February 4, 2017, 12:18 pm

(Feb 4, 2017 06:02 AM)NullDB Wrote: [\[CITE\]](#) Good luck with this guys, but how come Orcus isn't up as a recommended paid rat considering Armada is on the team.

All Anti-virus software is disabled. Any help would be great, thanks!

If you followed my guide there should be reason it does not work.
You're probably not using localhost to test your file or windows defender is ninja deleting it as is mostly the case.

Yuno - February 6, 2017, 11:08 am

(Feb 6, 2017 12:04 PM)Purple Kief Wrote: [\[CITE\]](#) Your antivirus software probably has a firewall of its own. Disable it.

So in order to use this on my computers on my local network I'll just need to use 'localhost' when building my file instead of my dns?

Exactly. You can type 'localhost' or 127.0.0.1 both will work fine.
Do note this won't tell you anything about if your port is working correctly or not, you'll need an outside connection for that.

Or if you have a seperate computer, connect to your VPN on the computer the RAT is running on and test on the computer without VPN. (basically serving as a seperate networkà

Run it on your actual computer, disable all settings possible aside from the connection settings obviously.

If the connection doesn't show all that has to be done is close it in task manager.

Yuno - February 6, 2017, 12:23 pm

(Feb 6, 2017 12:49 PM)Purple Kief Wrote: [\[CITE\]](#) Run it on your actual computer, disable all settings possible aside from the connection settings obviously.

Okay. I wont lie, sorzus is much more qualified here to discuss this with you than I am. I have just now sent him a message and should be in touch soon.

Sorzus - February 16, 2017, 4:36 am

Hey jo,

every server needs an ssl certificate in order to start and accept connections. While these certificates are automatically generated in the GUI version to make the creation process easier, you have to give some information in the console version. Actually, these information don't really matter, you could input everything, but I would advise to use a strong password / maybe generate it with a password generator ; you don't have to remember that password aftet you gave it to orcus. As a subject, you can just use "orcus server" or something like that, as already said, that is only needed for the generation.

Codefuser - February 16, 2017, 4:44 am

I see that you are recommending ByteCrypter. However, please pay attention to things like this:

<https://hackforums.net/showthread.php?tid=5483000>

Additionally, the crypter's inbuilt scanner manipulate scans. The crypter also uses smartassembly, ask any competent crypter developer about using public obfuscators for reFUDding, and you will see why byte crypter sucks.

Armada - February 16, 2017, 5:51 am

(Feb 16, 2017 03:49 AM)Fucci Wrote: [\[CITE\]](#) Now it asks for Subject:

Exactly, although it is recommended to store the password and NEVER share it with anyone. This key will be used to decrypt data sent between the host and the client.

J.?

I can't really say something useful about this. The only thing I know is that in the very start of the product it worked all fine and the scans were NOT fake.

What I recommend one and only is cyberseal, this developer will not let you down in anyway. The price is surely a little higher than others but the quality is very worth it.

Byte crypter overall isn't a bad crypter, I used it and surely sometimes it doesn't do exactly what you want but with the right settings it gets the job done and is indeed UD.

I hope that helps you understand our recommendations.

J.?

I have ByteCrypter listed here as I have been using it longer than any other tool and it's always worked for me.

That being said, I obviously don't want to recommend products that manipulate the customer and produce fake results. I'll look at other options and be revising the list to provide more consumer friendly software.

Armada - February 16, 2017, 6:09 am

Byte Protector would be my overall recommendation as well.

Black Coat Crypter used to be great, but unsure how updated it is recently, or if the project is still in development.

Literally went in and took a look at the few ones I had kicking around and Byte would be my recommendation, as noted.

Guess I can delete Razor Crypter now huh? ?

Codefuser - February 16, 2017, 7:06 am

Crypt a file with ByteCrypter. Do not use smartassembly on it. Scan on pscan/nodistribute/majyx. Scan in the inbuilt scanner.

Big difference.

Purple Kief - February 16, 2017, 7:09 am

Replace byte with DP4 and save all these poor people that will spread 8/35 files without even knowing.

Codefuser - February 16, 2017, 7:12 am

(Feb 16, 2017 08:09 AM)Purple Kief Wrote: [\[CITE\]](#) Replace byte with DP4 and save all these poor people that will spread 8/35 files without even knowing.

Or even better, Rata Protector, Octopus Crypt, Static Crypt or Broad Crypter.

bzr? - April 18, 2017, 11:00 am

(Apr 18, 2017 10:09 AM)Snexos Wrote: [\[CITE\]](#) I Have buy Imminent Monitor and Cyber Seal Crypter can you help me to use crypter ? have many option and dont know how choose
The key is to not cross-use settings.

For example, don't use startup in the crypter & the RAT. One or the other. This goes for nearly all settings...

As a rule of thumb, expect problems functionally with your RAT if you crypt it. Some things like updating or uninstalling clients may cause you problems.

HaxGuru - April 18, 2017, 12:51 pm

I just got into RATS the last few days, now I downloaded SpyNote to build an android rat but I have no experience in things like the IP and ports and such. Can you maybe help me out with this? I would appreciate that.

Hello , i have buy Orcus , can you help me to crypt stub ? i use CybearSeal Thnx

Dr. King Schultz - April 26, 2017, 4:49 pm

So what is the current state of RATs? Thinking of buying one, but last time I used them they all lost "stealth" mode or whatever, and notified the monitored pcs.

bzr? - April 26, 2017, 5:48 pm

(Apr 26, 2017 04:11 PM)Snexos Wrote: [\[CITE\]](#) Hello , i have buy Orcus , can you help me to crypt stub ? i use CybearSeal Thnx

Sorry but I can't provide support there. Being a part of the Orcus team restricts me from supporting 3rd party products in use with Orcus.

(Apr 26, 2017 04:49 PM)Dr. King Schultz Wrote: [\[CITE\]](#) So what is the current state of RATs? Thinking of buying one, but last time I used them they all lost "stealth" mode or whatever, and notified the monitored pcs.

(Paid) RATs these days are well monitored. To my knowledge, Imminent Monitor monitors the most information, which you can find on their EULA. LuminosityLink monitors too, and also has country wide restrictions. Orcus monitors the least. There is no licensing system, just a license key. If you purchase a RAT and are intending on using it maliciously I would advise against it.

TheChi?f - May 8, 2017, 11:49 pm

Bringing this back up in case someone requires help.

We have a new service that'll be released soon. Stay tuned! ?

Mykindos - May 9, 2017, 10:09 am

Alternatively to a VPN, is it possible to setup a SOCKS5 Proxy on a VPS and manage your clients through that instead?

Using software like proxifier you can limit certain applications to go through the proxy and still do everything else on your regular connection

(May 9, 2017 10:09 AM)Mykindos Wrote: [\[CITE\]](#) Alternatively to a VPN, is it possible to setup a SOCKS5 Proxy on a VPS and manage your clients through that instead?

Using software like proxifier you can limit certain applications to go through the proxy and still do everything else on your regular connection

Entirely possible. The connection speed may take a hit but I don't see any major obstacles.

I had someone PM and ask if this was still active, so just to say that it is indeed alive and well. Feel free to post here any time.

I have a issue.

I want to rat my own PC in order to have access to it when I'm at work. The problem is that the server doesn't startup with the launch of my PC. When I click on the server I see my client appear, but I power-off my PC and re-launch it, I have to click on the server again.

Is there a solution ?

Note that I don't have any AV on the PC I want to RAT.

I use Orcus and Imminent with CyberSeal Crypter.
Maybe you could suggest me the right settings.

Thank you for helping.

If you're wanting to use it on your own PC why would you use a crypter?

Because I didn't manage to startup with Orcus and Imminent.

Well to be totally honest I'd just use either of those two and not bother with the crypter, that's probably causing the startup problems anyway.

With Imminent Monitor just enable startup but make sure you have disabled windows defender because it will still stop it executing as a virus if its not crypted.

Would like to talk with some of you guys. I need help setting up a RAT for MAC from a PC. So if anyone could help me with this crossplattforming RAT it would be nice.

I am willing to pay for your help :)

PM me pls with Discord/Skype or Jabber Names. It would be very nice, if we could finish this today, i am on a hurry :(
