Thread: [NanoCore - Reverse Proxy Guide and Support.](#)

\$lick - February 9, 2017, 2:29 pm

This guide is for [NanoCore](#).

Reverse Proxy
What does it do?

Reverse SOCKS allows you to use your clients public IP adress while browsing the internet.

How do I use it?

You will start off by enabling the 'Network' plugin in your plugins tab, followed by restarting Nanocore so the plugin becomes active.

You will then go to your Clients --> Connections tab and right clicking the client you wish to use the reverse proxy on.

You will then hover over 'Network' and click on 'Create Reverse Proxy'.

You will then be greeted by a box that looks like this. You can just leave this default or if you are experienced you can modify this to your liking before hitting continue.

When you've hit continue you should automatically be brought to the Network --> Proxy Manager tab which should look like following.

You're now at your final step, you can whipe the sweat of your face in just a second.

In your preffered browser of choice head over to your 'Networking' tab.
In mozilla firefox this is done by clicking on 'Settings' --> 'Advanced' --> 'Networking' and this should look like following. (I know my picture is Dutch but it looks the same)

Click on the button indicated with the red arrow which says 'settings' and then you will copy what I'm showing you in the picture down below. (The port will be different for you!)

You can then click 'OK' head over to <http://www.whatsmyip.org/> to check if your IP has indeed changed!

You've now completed the reverse proxy guide. Should any issues have arrived during this please head over to <https://nanocore.io/support/> to ask for official support!

Wouldn't proxifier be easier to set-up?

And nice guide Purple Kief! Didn't know you are Dutch!

You would need a 50char password as well.

It's not really 50 chars, but it's a lot.

(Cant say the actual number)

Currently re-working this, will post update soon.

Surge0n - March 17, 2017, 9:14 am

Great tutorial. Could you make another about the hidden RDP feature.
