Thread: [Get string from website frame source](#)

denn1s - February 12, 2017, 7:03 am

Hello,

i want to get a string with a webbrowser from this :

```
exerciseEACABA.addItem("EJAACABA","acht|8");
exerciseEACABA.addItem("EHAACABA","5");
exerciseEACABA.addItem("EFAACABA","8");
exerciseEACABA.addItem("EDAACABA","3");
exerciseEACABA.addItem("EBAACABA","4");
```

he need to get the "8", "5", "3", "4" to a string / array list.

the "exerciseEACABA" is always the same on every page but "EBAACABA" is changing everytime.

sorry for my bad english but i hope someone can help me out.
my goal is to make a bot for this website to fill the answer automaticly.

Thanks for helping
Sincerely Dennis

I wouldn't use C/C++ for this, personally. Could you provide more context of your development environment and project?

There's nowhere near enough information here. Based on the description you gave the solution requested is simple string parsing, since we have no idea if this is in some kind of <script> element or where you're getting this data from.

Locate the function call, then extract the second argument, and grab the digit from the string in side the quotes.
