Thread: [Fix a PHP script after purchase from PayPal](#)

Malentor - February 12, 2017, 11:01 am

I have a website that handles PayPal to Bitcoin exchanges, the buyer needs to fill a form with his PayPal email, select amount and currency to pay with PayPal and then he is redirected to a paypal button with the previous details.

Here some pictures:

It contains a mailer function that every purchase that is performed, it needs to send an email to the PayPal buyer with a message including transaction number, his name exactly as PayPal , amount paid + currency , and the contact trade.

The mailer function unfortunately does not send the mail , the rest is working just fine.

Name a price to get it working with Gmail and also should work with my own SMTP server.

Have you tried using the PHPMailer? Its usually perfect for this kind of thing.

<https://github.com/PHPMailer/PHPMailer/>

Did you implement it yourself or get the source online?

Try sending it to a yopmail account and check out the results.

I've tried with several servers (outlook, gmail , my own smtp server) there is something wrong with

the code that it does not send it.

Do you have this on regular hosting or did you buy a VPS or dedi and set it up as your own little hosting server? If you bought a VPS or dedi you need to make sure PHP mailing capabilities are enabled I had this issue in the past a long time ago with a website I used to run.

Click this link if you manage your own hosting on dedi or VPS:

<http://imgtfy.com/?q=enable+centos+to+send+mail+php>

If you are using regular shared hosting and you are sure your PHP script is fine (sending an email really isn't hard, not easy to get that wrong), then send a ticket to your hosting about this. ?
