Thread: [Computer after 3-4 Hours getting into auto sleep mode and starting to make HARD noise](#)

Lufasu - February 14, 2017, 8:56 am

Well, after 3-4 hours, my PC got into sleep mode (automatically) and the fans started to work very fast and because they work very very fast they make loud noise..

I tried to move my mouse to exit this sleep mode or something but nothing works, i had to restart my pc to get this off, someone know whats the problem?

archangel.dmitry - February 14, 2017, 9:13 am

Some computers configured to switch to hibernation after certain amount in sleep mode.

do you have dust bunnies or some shit thermal paste? Sounds like someone is running a bit HOT.
Do you happen to have a AMD space heater OP?

You can disable it, what OS are you running?

Lufasu - February 14, 2017, 9:46 am

Toddeh - February 14, 2017, 10:01 am

First thought: Heating problem. Other than that you may have some temp/fan settings out of place on your gfx card. Download CPU-Z and make sure you're temps arent running above 65celcius. It's odd that it's only doing it when it sleeps.

Maybe you've been ratted and theyre bitcoin mining when the PC is idle after 3-4hours.

Nah, the point is the pc isn't even ratted and all the things i downloaded its only games from steam/uplay.

Also the pc was not in idle at the time.

It was more of a joke.

Get back to me when you've checked your temps and config - PM me if you need a hand.

Fiber - February 14, 2017, 10:08 am

Sounds like gpu issue, I've had this before all screens go black and fans ram up to max rpm. Try reinstalling your drivers or make sure they're up to date and see if the problem persists.

What GPU are you running? Mine also started randomly and finished randomly. I could be wrong but it's a good place to start.

Toddeh - February 14, 2017, 10:17 am

The only other thing it could be is a scheduled defrag or antivirus scan that's running when idle/sleep

Lufasu - February 14, 2017, 10:19 am

I bet its the hibernation thing since i read about it and its exactly matching to the things that happening to me.

"computer using zero power" and "fans keep working"

Then probably not my theory. Try running some benchmark tests see if it's actually a hardware fault or a software/os problem.

Well, a guy say i can disable it, i'm waiting for his comment :D

archangel.dmitry - February 14, 2017, 10:43 am

Open Command Prompt as Admin and type:

Quote:powercfg -h off

Restart just in case.

Lufasu - May 3, 2017, 5:33 am

This is still happening :(

Someone have an solution?

my monitor turning off and fans doing HARD noise and the PC is working like nothing happen just the monitor is black and PC fans making noise.
