Thread: [\[Release\]\[Beta\]Magnetic accelerator cannon v2 \[SLOWLORIS\]](#)

eridanus - February 15, 2017, 12:05 am

Hmm well i was just thinking about to release it much before but didn't quite get the time, so here it is now the first stable release of MAC.

Overview:

- 1)I had first released MAC in the VB dev. section just as an experimental product out there for test.
- 2)MAC actually is a very powerful slowloris tool with custom enhancement scripts to make the attack as feasible as possible from a single computer.
- 3)After 2 months of rigorous testing it is finally out for release and i also plan to make it available on sourceforge.

Functions:

- 1)Well most of the functions remain the same as before like
 - *)Pinging target.
 - *)Adding custom headers.
 - *)Enhanced scripts to make thousands of connections at a time.
 - *)[NEW]Added hide button to run it as hidden and not even be available in task manager. So only a logoff can shut it down.

System requirements:

- 1)Although not much is needed to run MAC, but it can be a bit demanding on processors. A good dual core 2.5 GHz is the minimal requirement for optimum performance (more processor cores mean more power) which can be increased as per requirement.
- 2)Also be sure to have the VB6 runtime environment installed (included with package). May not be required in some XP machines.

Finally the virus scan results fellas:

Old experimental version can be found here: <https://hackforums.net/showthread.php?tid=5501871>

Well there is an update:

That if any user finds out a bug in the program, he/she may report it to me by pming me, so that I can always keep it neat n clean.

Thanks.
