Is there any way to capture a screenshot when there comes some particular words on the screen/top most window?

g4143 - February 20, 2017, 4:04 am

You'd have to write a hack for the windowing system the OS is using.

I'm making a rat like app for a company which want to spy on employees ... they want a feature like capturing a screenshot when a particular word come on a site like twitter, facebook

Why the hell would they need to capture the screen? You could just log all browser requests or outgoing traffic.

Realistically a company would have a firewall with rules to block certain websites that would distract employees.

You should be more forward if you want help, this doesn't sound legitimate at all. Like g4143 said, you are better off analyzing outbound traffic.
