Thread: [What can I do with the cache from Firefox/chrome folder?](#)

naxster - February 21, 2017, 10:52 pm

Hello guys I'm just wondering, let say that I have physical access to a computer, but they haven't saved/stored their password on either chrome or Firefox (they always write their password)...

I do know that I have some options such as keylogger etc, but I'm just wondering, is there anything I could do with the caches from either chrome or Firefox? I mean let say that I copy the whole chrome folder to an USB and later transfer it to my computer, could I at least access his Facebook page with the caches?

I do know about Firesheep, and I thought if it works the "same" with the caches and all that stuff? :)

There is nothing much useful you could do with their cache, just install a silent logger mate. If they are using win10 there is one already installed :)

Regards

Wait what? Hahaha there is already an keylogger installed in win10?? Where and how do I find that? :O :O

Also which silent keylogger should I use? Can I later obtain that logger from the Internet without having physical access to the computer again? For instance transfer the text files to Dropbox etc?

Yes to both of your questions. Do a little google search for win10 logger.

There are plenty of loggers you can install once and receive log files on remote server :)

Regards
