Thread: [Couple of database dumps -> Website](#)

jawing - February 26, 2017, 12:43 pm

Hi guys!

I have a bunch of database dumps in txt and csv, whenever I need to search through my lists, I have to use notepad ++ and sometimes it crashes because its too big.

I wonder if there's a search engine source code or something so I can put this stuff up on a website, something like haveibeenpwned.com

SaceLandon - February 26, 2017, 4:17 pm

this is what i've been wondering too, and apparently I havn't been keeping up, just read <https://www.cyberscoop.com/breach-database-leakedsource-reportedly-raided-feds/>

leaked source was taken down so why hasn't haveibeenpwned and others also.

if making one of those sites, it would have to be private I would think, like not raking in hundreds of thousands like LS

interested if others know how to make this

Because HaveIBeenPwned doesn't sell access to search their database. They also remove things when asked to.

interested if others know how to make thisIt's because they gave access to the databases as Drug Problems stated

My site is not going to be as big as those, I will mostly have Swedish databases on mine.

Is there a text-editor to open large files?

eMacs/Sublime.

creativethinker93 - March 3, 2017, 11:03 pm

maybe try rename to .txt open shell do cat yourfile.txt | grep -e "key word"

StyleShit - March 5, 2017, 10:08 am

Import them to pma or something and you'll be able to search using queries. Easier, faster & better :)

interested if others know how to make thisHaveibeenpwned doesn't actually show any sensitive data, and most databases are put on there with permission.

Clutch - March 6, 2017, 12:15 pm

If you're just looking for a way to easily view large files on your local system, fire up your command line and use those tools. On Linux you can use less/grep/cat. I'm sure there are equivalents on Windows.

wellah - March 6, 2017, 12:23 pm

use grep and put all the databases in one folder

xfreedom - March 7, 2017, 2:09 am

If you open the txt files in windows, use glogg.

TheMagnificent - March 7, 2017, 9:13 am

Use Sift. Sift is the fastest and easiest tool to use, and you only need to put a .exe file and put in ur /System32/ (i presume ur on windongs) fire up ur cmd, cd to a folder, 'sift "string"' and there ya go. That's what i use to search through my databases.
