Thread: [File Builder](#)

Stenly21 - March 2, 2017, 10:52 am

Hello Everyone,

I have a question,

I want to make a program that will build an exe or other file format with the options you choose, i know how to do it with a batch file but not with things like an exe. For exemple i want an option so you can choose what options the keylogger will have, then build it.

Please help me.

Thank you in advance!

CodeDom.

Look at my threads for an example.

Barret - March 2, 2017, 6:19 pm

I wouldn't do that, just saying.

Lucasheer - March 2, 2017, 8:09 pm

The easiest way with .Net (In my opinion) :

- 1) Create a script engine, or some way to change the application from a string (Or a class with instructions of how exactly to modify application).
- 2) Implement your script engine in an empty .Net application. (Have it read when a string is sent to application, and store this in application settings to be used later)
- 3) Create a "compiler", that whenever you compile code, it will send the code over to your empty .exe. Then, that application will run the script every time it is started, since the script is in the settings.

If you're wanting to make just a key logger customizer, then make an empty key logger application, that will change in settings whenever a string is sent to it.

Ofcourse, you can go through other methods of "building" an executable. But for something simple like this, you don't want to make a full on compiler.

Back in the day, I created a script engine called LHScript. The old version was poo-poo, but I'd be willing to make a new cool version if you skyped me. My Skype is LucasHeer715

Some features of LHScript :For Loops

While Loops

Variables (Global/Procedural)

If Then Statements

Modules/Classes

GUI Building (Full VS Designer) --> Seperate from LHScript, called LHDesigner. The older version

was also poo-poo :(

Functions/Sub Procedures

Complex Expressions

Others...
