Thread: [Manipulate a video file and open just on specific system.](#)

hack3rcon - March 7, 2017, 4:18 am

Hello.

Can I manipulate a Video file that just can open on specific system? For example, A movie just can open on systems that their names are "GoodUser".

Thank you.

Probably easier just to make the file into a .zip and add a password....

Otherwise you would have to write a piece of code to check the username ect... then bind it to the file...

Just .zip it.

You are looking at the concept of DRM.

Here is a detailed answer
What is DRM?

Digital Restrictions Management is the practice of imposing technological restrictions that control what users can do with digital media. When a program is designed to prevent you from copying or sharing a song, reading an ebook on another device, or playing a single-player game without an Internet connection, you are being restricted by DRM. In other words, DRM creates a damaged good; it prevents you from doing what would be possible without it. This concentrates control over production and distribution of media, giving DRM peddlers the power to carry out massive digital book burnings and conduct large scale surveillance over people's media viewing habits.
