Thread: [Setting Up Work\(Hack\)Station](#)

The2G - March 9, 2017, 7:36 am

Hi mates,

I am trying to set up my Work(Hack)Station Server for various purposes...

I want to know how that is done in the right way; I mean:

- Where and How can I rent a server without giving any personal, at least my real data?
- Do I use a VPN connection to connect to that server and use another VPN in the server for doing tasks? Ex: Botnet C&C
- If I want to host scripts should I encode/encrypt them before publishing?

I basically need a server to host several scripts and other stuff...

Thanks!

Hope I don't violate forum rules asking for that.

You could get a Virtual Private System that supports bitcoin payments

something like <https://coinshost.com/en/vps>

They have both windows/linux vps and support bitcoin as payment.

Code Do I use a VPN connection to connect to that server and use another VPN in the server for doing tasks? Ex: Botnet C&C

It would be wise to use a vpn or tunnle through a private proxy before using the actual VPS and then use a VPN or proxy tunnel on there yes. It would slow down connection speeds alot but should be decent masking.

Code if I want to host scripts should I encode/encrypt them before publishing?

Yeah if you can that helps as you dont actually own the computer system your VPS is on but renting it so the VPS admins could check the OS. And the server your are hosting scripts on could always be exploited with certain include exploits to show or dump the files to them. So encrypting the source would be wise.

Mr X is right you want a VPS, find one with trusted service or ask around on HF.

The2G - March 9, 2017, 10:46 pm

Thanks MR - X!!

Would search about hosting services that accepts BTC payments.
