Thread: [Can u use SET to make an infected USB?](#)

DARK PEPPINO - March 13, 2017, 9:34 am

There aren't many informations about SET on the internet

THC - March 13, 2017, 9:47 am

I don't know, can you?

There is a TON of information about SET online. Here.

<https://github.com/trustedsec/social-engineer-toolkit>

<https://www.trustedsec.com/social-engineer-toolkit/>

<http://www.social-engineer.org/framework/se-tools/computer-based/social-engineer-toolkit-set/>

If you want to google it, then you search it like this, Setoolkit.

vaiperboy - March 13, 2017, 12:44 pm

man, if u even try opening set u'll find it right infront of u lol

also, define infected, infected with wat? if you're talking about having a meterpreter or shell remote access do the following (if u wanna be a skid kiddie anyways)

do:

setoolkit

1 (social engineering attacks)

3 (infectious media generator)

2 (metasploit binary)

2 (meterpreter, if u want that anyways. or 1 for shell [cmd] access)

wait for it to generate the 'infection' (payload would be the correct term for it tho), then head over to /root/.set/autorun (.set is hidden tho, to unhide it do ctrl+h) n copy it to le usb (it comes along with a autorun.inf file as well but it would pointless as it doesnt work on any windows newer than vista)

then choose yes (if u wanna start the listener right away anyways)

after a couple of seconds metasploit will pop up, make the victim run program.exe on his laptop (please note, since many kids use metasploit almost all of its exe's are detected by window defender [or ide]), so u gonna have find a way around to 'fud it') then some text will show up on ur laptop as a 'update', do sessions then u will find ur victim session along with a number (starts from 1), then do sessions -N (N is the number of the session, if theres only one session then its 0)
