Thread: [Question about programming in python for class](#)

KanyeMidEast - March 30, 2017, 6:27 pm

Hey I just started taking a programming class since I wanted to learn but never tried to learn by myself, anyways i'm a little confused since my professor wants us to learn on our own before showing us how to do it.

This is what we are supposed to do <https://gyazo.com/c7d1b357bbe78ac7827fc763d649848b>

and this is what mine looks like <https://gyazo.com/b78c68fa27b73b9a0e376a633bf17443> (theres a name I just blanked it out)

Sorry for the simple question.

Put the code you put into the interpreter into a python file. (ending .py) instead. Then execute that file.

From that window, click File->New file. Put the code in popped up window. Then do Run -> Run Module for it to run.

ende124 - March 30, 2017, 10:59 pm

Instead of writing the code in the shell, try making a file that you can run. What you're doing now is writing a line of code in the shell and immediately executing it. What you want is a file.

To do this click File, then New File. Here you can write how much code you want before running it.
