Thread: [Need Help! Connection problem with Quasar RAT.](#)

albertftw - April 3, 2017, 10:56 pm

Hi guys, I'm trying to set up Quasar v1.3.0.0 for a small office and home and I'm having problems getting it to work.

I managed to portforward successfully and setup a Dynamic DNS service.

Now when it comes to testing the stub, I tried running it on my own desktop (via Sandbox) and another laptop connected to the same LAN connection at home, but it won't connect to Quasar.

The thing is, if I change the network settings to connect to my LAN IP (192.168.x.x), the connection works on both Sandbox and spare laptop.

Now, this would be an awesome fix if not for the fact that I have to install it on the office desktops (3 desktops all running windows 7 x64), and changing the connection setting to connect to LAN wouldn't work for the server that's running on my desktop at home.

Is this a problem on the Dynamic DNS or the way I setup my stub? Any help would be greatly appreciated.

Also, I'm not encrypting the stub so no problem there.

edit: /bump I really need help with this. :)
