Thread: [I need a simple script that I can run on linux. Either it be a javascript or bash.](#)

Leroy Jethro Gibbs - April 10, 2017, 2:29 am

So pretty much, I'm dealing with an annoying deface on a website I got access too. I don't have the ability to wipe the DB and I need to clear pretty much all of the submitted testimonials.

I need a script that counts up by one and navigates to a link.

So something like this.

```
Goto http://sitehere/admin/delete_testimonial.php?id=1
id=1+1
goto http://sitehere/admin/delete_testimonial.php?id=2
id=2+1
```

etc.

Probably the shittiest example known to man but its what I need lol. If anyone can help, thanks!

Create two variables, ID that starts at 1, and one that is the total amount of entries that you want to delete.

Setup a loop so that it constantly checks to see if the ID is greater than the total amount and if not it goes to "http://sitehere/admin/delete_testimonial.php?id=1
id=ID+1" and then adds 1 to the ID.

Not sure how to make that kind of script. I was hoping someone could do it for me since I'm kinda in a rush and don't have the time I need to learn the shit myself.

Working on this. Will update.

EDIT: Alright, I am not professional, so this code might be broken, but I gave it a shot. I know that Javascript code loaded in the console will not be there when a page is reloaded. So, I approached it

with iFrame, because I suppose something will happen when a page is loaded.

Make a html file with following code:

<https://pastebin.com/raw/FFyHjQbF>
