Thread: [Linux \(centos\) install help](#)

wanbetaaler - April 10, 2017, 7:53 am

Hello fellow HQ HF members,

I bought a vps that should be able to do the following things;

- web hosting
- database
- php
- nodejs

- file hosting
- backup system
- ftp management
- vpn

specs:

2 cores

4.096 MB RAM

150gb SSD

5000 GB DATA

and i bought a big storage of 2TB with it.

I rarely use command line.. (always worked with windows, but its time to step to the linux side)

So i choose CentOS to be my main os (because i heard most developers use this OS and its free)

Currently i am stuck at the following decision. It is asking me to choose a Base Environment, and I do not know what i should choose! This is where you step in.

I googled some bits and bytes about it. I saw some personal recomendations to other people but I'd like to hear some tips and stuff from the guys in this community.

So tbh if i can i dont want to go PURE command line only. if it is possible for me to have a GUI that would be nice. but if its not recommended at its highest grade, I wont do it.

I was thinking of installing the: Development and Creative Workstation or the Server with GUI or the Basic Web Server.

What do you think i should install
(FIRE AWAY)

Thank you for your input.

Do you also have any idea of what base environment i should install?

Which one do you recommend for me?

I like Ubuntu 16.04 but Centos 6 isn't too bad.

Well for more information about Centos (7)*

this is where i am stuck at.

Spoiler [\(Click to View\)](#)

And currently I am clicking options on which seem usefull or cool by name xP

You'll be better of installing Centos and then manually installing what you need.
