google it lil bitch

hahaha idk if you can read but some files are infected and their harmless. and some files are infected but have a rat in them. how can i tell the difference is what i want to know.
ya lil bitch

Why would you want to download them either way? o.0

Sparkfear - April 13, 2017, 1:27 pm

The most simple method would be:

You could protect yourself by:Installing a VM

Installing sandboxy

You can also scan the file with:Nobot

VirusTotal

Hybrid-analysis.com

By now you should know your answer.

BITCHLESS - April 13, 2017, 1:28 pm

Upload to malwr.com and check results

This. Or manually check if the program tries connecting to any servers once you run it.

This makes almost no sense. How can a file be harmless if it is infected? Or are you talking about false positives? Are you trying to distinguish a file between a RAT and another type of virus?

Kuri - April 13, 2017, 5:10 pm

Virus total or using a virtual machine.
