Thread: [mac spoof repeater](#)

hmttd - April 21, 2017, 12:44 am

hello I'm new here and got a problem I thought you may can help me out..

we have a wifi router with several repeaters at work (hotel) and since i don't wanna pay 10bugs an hour for wifi i spoofed the mac address on my phone to the one of a cashier pc system. works fine cz i got a rooted phone. also on my thinkpad running kali it works great. but i want it to work on my main pc which is running windows cz i need it for music production. i tried like 10 different ways to spoof mac on windows but with no success. so i wanted to use my thinkpad connecting to the wifirouter with mac spoof and act as a repeater using a second wifi adapter (alfa awus036nha) to send to my pc. is that possible? or will the pc have to spoof its mac anyways? and if it won't work does anyone of u know a working way to spoof mac on windows?

hmttd - April 21, 2017, 11:56 am

wow I just signed up and already met the first jerk who either can't read or just wants to get on ppl's nerves.

MAN as I wrote I've already tried all methods to spoof mac address on Windows I'm very familiar to "google" or why would I signup to a forum like this to ask this question if i could simply find a solution through the big G huh?

NONE of all these tools for "mac spoofing" works. it either says "you can't set a mac address like this missing 02 char" or it simply doesn't do anything to my card. I believe there's no mac clone thingy like in linux systems so that's what i wanted to know. and also this was a subquestion as my main question is above that. you should get better glasses man. thx NOT.

Try using your kali laptop to create a fake access point that piggybacks off of the one you mac spoofed. Then, your regular pc can connect to it.

As he said, hook up the alfa into your Kali pc and use it as a hotspot. Your windows wont need to spoof its mac that way since its running through the thinkpad.
