Thread: [Tampermonkey Inspect Element Script](#)

EasyPeasy - April 22, 2017, 7:11 am

Does anyone know where i could possible find a tampermonkey inspect element script?
I'd be very thankful, I need it for a CPA video!
Thanks :)

(Apr 22, 2017 07:11 AM)Yani Wrote: [\[CITE\]](#) What are you talking about?
Basically, when I refresh the pages, it still shows what I inspect element earlier.

I think no such tool exists where you can edit website with just modifying using Inspect Element.

Definitely possible. Not editing the website, I'm only editing the version on my computer. :)

Mr. Robot - April 22, 2017, 7:19 am

Just open a new browser in say incognito?

CTRL+SHIFT+N /// On Chrome

CTRL+SHIFT+P /// On Firefox

Or just copy all the inspected elements out to a n++ file.

You can check out with xadam... one of the mentors of HF. He has a good hold over scripts or just checkout scripting section dedicated to js users.

Oh god Yani, I think you're right.

SIM-2223238 - April 22, 2017, 7:21 am

It's eassy with some simple editing or download the site using httrack and modifying it.

Yeah, that is correct, but not the right scenario. I'm developing a fake proof in a niche. Basically I will change the amount of currency in the game and then when I refresh, I need it to be still here, just for the video!

(unless you are trying to edit something in inspect element then refresh the page, and keep what's happening in inspect element, in which case I would just make a copy of the page and host it locally using something like xampp then change your DNS settings so when you go to website.com it will redirect to 127.0.0.1)

You can just open a new browser in incognito or private browsing.

As my above post says - your best bet and the easiest way.

Download Xampp

Download a copy of the page you're looking at.

Make the changes in the source of the page you need.

Host Xampp on 127.0.0.1

Change windows dns settings to redirect when you go to website.com it will actually load 127.0.0.1 and when you refresh the page nothing will change.

Shouldn't you deserve the Genius award ?

Looking at OP's sig, seems sketchy ?

Host Xampp on 127.0.0.1

Change windows dns settings to redirect when you go to website.com it will actually load 127.0.0.1 and when you refresh the page nothing will change. That is very smart. Thank you very much, :)

Do you mind if I PM you if I have any questions/problems? ?

No please do not PM me, I wont help you scam people or deceive them. Read my posts or ask questions on here so if I can't be bothered coming back - another user can help.

(Apr 22, 2017 07:29 AM)Evanescent Wrote: [\[CITE\]](#) Basically Mr Robot here is speaking regarding a localhost.

Well it's the easiest way right? Imo it is

Zajekeroni - April 22, 2017, 7:34 am

Use Fiddler. Very surprised no one mentioned that yet.

Mr. Robot - April 22, 2017, 7:36 am

Oh god haven't heard fiddler in a long time.

You aren't wrong - OP use fiddler.
