Thread: [Konboot | Win10 | USB](#)

thePoltergeist - April 23, 2017, 7:34 am

Hello!

I am having a few issues with kon boot and windows 10. It goes something like this:

- I go into the BIOS, turn off secure boot
- Boot to the USB with no issues
- Konboot loads and says successful, asks me to press enter to continue
- I continue on and just before windows 10 loads I get a message saying Konboot has been unable to start.

Anyone else experienced this?

xfreedom - April 23, 2017, 10:22 am

Yes I did, eventually I tried and tried again until it works out, I think it's windows 10 preboot antimalware or something like this since I saw a glimpse of a message.

And since konboot doesn't work with live account, another possibility is to either activate the hidden admin by using the utilman.exe trick or by decrypting the SAM file.

Trivexlium - April 23, 2017, 10:25 am

Mine tells me it wont work with Microsoft accounts but I swore it did. I went with the "create admin user" option. Makes a user called kon-boot I think.

That may be it! The account is a live account. How do you create an admin user?

xfreedom - April 23, 2017, 2:22 pm

It's not because it's a live account though. Kon-boot can't bypass live accounts, but it should execute and ask for the creation of an admin instead.

The fact that it stops during execution is jst a random bug I guess.

As for the creation of an admin, you just need to google something like bypass windows logon utilman.exe or hidden admin utilman.exe and you should find a full tutorial.

I think this is an issue with Windows 10 compatibility. I think I heard something along the lines of legacy mode will help
