Thread: [Website cloning?](#)

Commander 11:11 - April 25, 2017, 12:43 am

Is there a tools for website cloning and then serving it on my PC?

The Beep Beep Sheep - April 25, 2017, 8:43 am

You can use Wget if you're on Linux. For Windows you'd have to Google for tools.

Code `wget --mirror --convert-links --adjust-extension --page-requisites --no-parent <website>`
--mirror – Makes (among other things) the download recursive.
--convert-links – convert all the links (also to stuff like CSS stylesheets) to relative, so it will be suitable for offline viewing.
--adjust-extension – Adds suitable extensions to filenames (html or css) depending on their content-type.
--page-requisites – Download things like CSS style-sheets and images required to properly display the page offline.
--no-parent – When recursing do not ascend to the parent directory. It useful for restricting the download to only a portion of the site.

This was going to be my suggestion. Just remember that the site you are cloning may be using internal resources you don't have access to. You may need to modify the code to get resources to load.

For instance say a resource being called on the site is `"/image/zerocool.png"` well that doesn't work for you because that is a local resource for the web server. So you need to modify it as `"www.clonedsite.com/image/zerocool.png"` which should load the image assuming it has open permissions.

check out darcy ripper, its what marketers use to clone landing pages and shit

kpown - April 25, 2017, 8:11 pm

There's a tool that comes with SET (social engineering toolkit)

Mirakuru - April 25, 2017, 8:30 pm

I would recommend Teleport Pro.

Rushax - April 26, 2017, 3:54 am

HTTrack all day long.

Reliability is really good, and copying speed is really quick. I get a load of requests to duplicate a site with certain changes here and there and I always use HTTrack.
