[Buy Here](#)

The Tevo Tarantula is a really cheap 3D printer. For only \$200 you are getting the printer + 2x 250g filament rolls + 8gb sd card (a really shitty card, but still).

I bought this printer almost three weeks ago. It arrived a week ago. I managed to assemble it in 3-4 days (assembly videos can be found on youtube and is really fun). The printing quality is really good for a \$200 printer.

Also, there is a huge facebook group dedicated to this printer ready to help with any possible problem.

Some of my prints :

Just out of curiosity, how expensive is it to run one of those things? How much would filament cost...?

1kg of filament costs about ~\$30

With that much filament you can print a lot of things.

As reference, all the pieces that i have in my hand in the second image only weight 30g. (30 pieces, ~1g each)
