Code socket.gaierror: [Errno 11001] getaddrinfo failed

Getting this error when trying to launch someone else's code. Its an account cracker for a flash game and happens when I try to connect to the games media server. Can anyone help me out? I can pass you the code in PM.

Check the server it's connecting to. Probably wrong IP or port.

I'm connection through their domain (media.domain.com and port 443) I could connect to it using telnet on windows cmd, although I get a bad request it shouldn't matter, right?.

Are you working behind a proxy/vpn? I think the guy with the fucked up name is right, it's the IP or the port or your outbound connection.

Got it working, had to remove http from the domain, didn't notice it. Now it just shows a black screen when it runs, Can anyone look at the code?
