You need Java JRE & JDK installed correctly in order to use this software.

My crypter only executes the main class of the file you are trying to crypt. Make sure the file you want to crypt can run out of another jar file using a Java Classloader.

It's a crypter, no dropper and no obfuscator. It just offers obfuscation as a feature.

If it is in java then why not simply obfuscate the payload? That should be runtime FUD?

(May 3, 2017 05:07 AM)Weco Wrote: [\[CITE\]](#) Because they are way more difficult than a C# .NET Crypter (which can be "coded" by any skid using copy&paste)

True, but I mean anyone who knows Java decently and have messed with reflections should be

able to make a Java crypter. But for some reason not a lot of people have stepped up. No need to make a RunPE, basically. A "RunJAR" would seem much easier to create I assume ?

I admit though way less likely to slap code around in a Java crypter. At least until someone posts the source for one lol

Hello, sorry that I was unable to respond earlier. My PC wasn't working. Please submit your error in my support Thread: <https://hackforums.net/showthread.php?tid=5607642>

?Anubis - May 9, 2017, 2:52 pm

I would like to test this, I work with bytecode (mostly advanced obfuscation) and I'm curious to know how this is achieved. If this is just an engine which encrypts the binary files it's really easy to bypass. If you still have vouch copies available please send me one.

(May 3, 2017 05:07 AM)Weco Wrote: [\[CITE\]](#) Because they are way more difficult than a C# .NET Crypter (which can be "coded" by any skid using copy&paste)Sorry but no, developing a Java crypter is way easier than a .NET crypter. You can code a .NET crypter by copy and paste but it won't be any good, if you want a decent crypter you need to do your own work. But anyway I understand what you are trying to say, it just that a copy and paste'd crypter won't be reliable.

Mr. Kim - May 9, 2017, 3:15 pm

(May 9, 2017 03:04 PM)Weco Wrote: [\[CITE\]](#) Sorry, but that's not really true. .NET has better and easier methods for loading from runtime then Java.

It's much easier to make a "Run Jar" if you will than a RunPE

That can't be denied

Oh you've got to be joking. Just because there's no material to skid from does not make it hard. For either you could throw some college-freshman worthy program together over a weekend and get FUD for a week or so. Especially for java since almost no AV engines parse java programs properly.

This is not a statement about what you're selling. Its about what you just said.

- 1) Because it isn't the crypted file but just a temp file. The tutorial contains an explanation of this and what the correct file is.
- 2) I am scanning a detected file. It doesn't matter what file I scanned, it's just important that the stub of my is FUD.

don't have any plans to close the sales :)

The only reason why I would close them would be if an unexpected event happens which prevents me from refudging.
