Thread: [How to crypt a Miner/LuminosityLink](#)

_Raz0r - May 5, 2017, 5:01 am

Hello, I'm french and I have bought the Miner (ROGUE MINER) & LuminosityLink.
I have also bought the crypter Spartan Crypter.

The crypter works fine, no crash and FUD but I have a problem :
Miner is FUD and Luminosity is FUD but twice aren't working on a computer with Avast and I don't understand.

Avast don't detect himself that is a RAT or Miner, no notification but when I launch the Miner or Luminosity build which are crypt and FUD, if Avast's modules are enable, Luminosity & the Miner close but no notification. And if I launch the Miner or Luminosity with Avast disabled, the Miner & Luminosity works fine.

Do you have an idea ?

Thank's you !

Its the avast then... Somethings not FUD in your setup

Frankey - May 5, 2017, 5:02 am

Im not some kind of professional so correct me if I'm wrong.

But maybe the file is only scantime FUD and not Runtime?

Or maybe there are settings within the crypter which are messing things up.

Yes but how to know if everything is FUD if the scanner says 0/40 ?

If you explain me how to scan a Runtime, maybe it will works ^^'

Is that miner dropping detected files?

Mitlar - May 5, 2017, 7:31 am

Last I checked spartan crypter was detected by avast on runtime.

_Raz0r - May 5, 2017, 9:07 am

I don't really understand what you mean, but when the miner is detected, miner is stopping working and it's deleted.

Thank's you.
I have add you on skype.

Ciaransbank - May 5, 2017, 11:02 am

i can crypt miners for anyone needing them email me at ciaransbank@gmail.com

malusdefou - May 6, 2017, 2:15 pm

Hi there ?,

Earm ... I recommend you to firstly disable telemetry and sending client infos and samples to avast service from avast settings if you use the crypter and your crypted file on your own, you're just sending samples to avast and making the crypting method detected .

AVs mostly have runtime modules that detects popular shemas of RAT's / Ransomwares / Miners / Wormes etc ... they analysed, so when the AV is activated, if you open a popular malware such as DarkComet or Nanocore or Lumonisity Link that has been scanned at AV's laboratories of sample analysing, so the schema is knows and modules are made to prevent their runtime execution.

It isn't a proof of non detection that scantime shows you a very low detection rate, patterns of popular malware payloads are known (which registry key is manipulated, dropping folder etc ...).

So, try using a non popular RAT, crypt it and try executing it with avast activated then give us news about it.(with my first recommendations about disabling cloud scanning of Avast to prevent your file being leaked ?).

I forgot to talk about another thing, check if it's the Avast Firewall who prevent the malicious traffic of your malware to arrive to you ... So, the malware works but the traffic doesn't leave the infected machine so you can't manipulate it. But this reason isn't an excuse for a silent crypto-miner to stop, this one should maybe be stopped because of his CPU usage if it's a Cpu mining payload ... ?

Peace&3XPL0ITS ?

Thank's you for your answer ;)

Copa Ammrica - June 19, 2017, 10:55 am

Where you able to solve this issue?

_Raz0r - June 19, 2017, 10:56 am

Yes, for Luminosity Link I just changed the cryper

Copa Ammrica - June 20, 2017, 12:44 am

I love French people when ti comes to good tools

Hnmmm Bro please can you suggest a crypter that is FUD in runtime 99.9% because i have been loosing installs with spartan lately despite using the installation on crypter and i use a c++ RAT ..

please lead me through and i will like to know does Data protector stay FUD always and works for C++ and .net

hoping for a positive response.

Regards

_Raz0r - June 23, 2017, 9:22 am

I have bought Data protector, it's a big ****, break Miner, and nosferatu remove my license because this idiot thinks that I do spreading

Thankfully I do not buy that crypter and bought spartan, although lately it is detecting AVAST,

KASPERSKY, ESET, MALWAREBYTES .. at the time of making FUD
