Thread: [Absolutely NO router exploits for an att home router](#)

Noobface80 - May 12, 2017, 4:45 am

Hey guys. Recently while browsing the interwebs, I've come across someone online who I wanted to test his security. He gave me the greenlight, and said as long as I don't cause any real damage. I was able to get his IP address, and knows that he's using an AT&T Motorola/Arris NVG510 router, but amongst searching for de exploits, I cannot seem to find ANY. I haven't yet checked on meta on my kali build, BUT it seems that I would at LEAST be able to find some on the internet (such as expl db or something similar).

Anyway, my paranoid ass thinks its because the isp's are deliberately removing the search results due to the fact that its their current cheap option. I also heard that isp's monitor/modify traffic on their customer's side which is why so many people root their home box.

Anyway, is it just a lack of posts, It's not that new (about 2k11-12) and that's long enough for anything to be exploited...idk anyone have any suggestions to help me ease my mind?
