Thread: [NSA Tool Abused By Hackers Biggest Attack In History Today!](#)

p0isoNx - May 12, 2017, 4:15 pm

I would update your windows pc's if i was you!

"The malware believed to be behind Friday's massive ransomware cyberattack appears to exploit a Windows vulnerability that Microsoft Corp. patched almost two months ago—underscoring how companies can fall dangerously behind the curve if they don't stay up to date with vital software security patches.

Security experts say having access to the latest software updates and patches is a separate matter from actually implementing those updates across a corporate network.

"Software patching has always been a problem amongst most organizations, as patches usually require testing before being deployed to hundreds and thousands of devices," said Nicole Eagan, chief executive of cybersecurity firm Darktrace, based in Cambridge, U.K., and San Francisco."

J?son - May 12, 2017, 4:16 pm

Confirmed - wcry ransomware spreading across Europe uses EternalBlue/MS17-010/SMB. PATCH NOW EVERYWHERE.

Mi2414 - May 12, 2017, 4:20 pm

Ransomware seems to be growing in size. Someone randomly taking your files an encrypting them, then forcing you to pay it is really low in my opinion.

ProtectNull™ - May 12, 2017, 4:24 pm

But hold on, you can't infect yourself if you don't use an SMB server right?

iPwned - May 12, 2017, 4:26 pm

This shit is crazy, how has it gone cross-platform? Usually they are OS-specific, If it's a ransomware?

J?son - May 12, 2017, 4:29 pm

How not to be hit by WCry 2.0: Apply MS17-010 immediately, remove NT4, 2000, XP-2003 from production, Firewall ports 445/139 & 3389. Simple.

N1l0c - May 12, 2017, 5:07 pm

That attack is insane! Holy crap, it spreads so damn fast. About 5 hours ago there were like 40k infected systems, now there are way more than 150k.

5chn4pp - May 12, 2017, 6:00 pm

The name is actually WanaCrypt0r

(May 12, 2017 04:24 PM)ProtectNull™ Wrote: [\[CITE\]](#) But hold on, you can't infect yourself if you don't use an SMB server right?

Just make sure SMBv1 is not running on your computer.

muzzzle - May 12, 2017, 6:40 pm

Holy shit, that sounds scary. I wonder what happens after you pay..

Orgy - May 12, 2017, 6:58 pm

robs-mbp:~ rob\$ uname -a

Darwin robs-mbp 15.6.0 Darwin Kernel Version 15.6.0: Thu Jun 23 18:25:34 PDT 2016;

yea nsa tool to hack into healthcare places smh

J?son - May 12, 2017, 7:45 pm

WannaCry ransomware today 74 countries

Imao damn nsa u scary

Holdstrom - May 12, 2017, 7:54 pm

This is pretty fucking crazy.

Genoboy - May 12, 2017, 7:55 pm

wew.. WannaCry now in my country tsk.. spreads very fast. I hope I won't get infected.. wahahhah
I did uninstall the latest update just for a game because is bugs it.. tsk. What do I choose, the game or the files in my computer?

stefsot - May 12, 2017, 8:04 pm

I think although the worm can spread itself from already existing machines it can't infect new ones

[source](#)

That could mean its no longer dangerous, good job finding that.

TheDudeOfSuh - May 13, 2017, 1:34 pm

It's interesting how it works since technically it wasn't a worm to begin with..

I have to admit in my opinion the part that makes me laugh is our government invented the program

or the initial tool to use it.

A little ironic for them to get pissed at Snowden for releasing information, but they can't even keep the tools they use locked up.

ConfusionG - May 13, 2017, 1:35 pm

But hold on, you can't infect yourself if you don't use an SMB server right?

5chn4pp - May 13, 2017, 1:35 pm

If you have "SMBv1" disabled, this variant won't infect you.
