Thread: [Search listview for dates within a range](#)

PriorityNew - May 18, 2017, 6:47 am

Hi,

I'm really stuck and I've been trying what seems like forever to search a listview by date (dd/mm/yy) to grab rows of data and move certain columns to a listview2.

Can anyone help?

Thanks

So you want to get listviewitems that hold a certain datetime value to be moved to another listview?

If so, just loop over the listview items, and apply a condition.

I want to get any dates in a listview that are within a range of two dates entered by the user. If the a date is within the two dates then it will grab other records on that row and move them too a listview2

Familiarize yourself with foreach loops.

Forget the word "listview" if you are programming. Listview is GUI it is for users only. You have to think about the databinding of the listview. The question is, is it binded with a datatable, with a list (of t) or something else. If the listview is not binded, then cast it to a list, sort the list (by date), filter the list (with the dates), bind the list with the listview2.
