[SilentBytes](#) | [JCrypter Seller: Tom Cruise](#)
[live:tomcruisehf](#)

Discord: Tom Cruise#5944

About

SilentBytes Welcome to a detailed guide to help you understand how to use and set up SilentBytes. SilentBytes is a Remote Administration Tool that can run on Windows, Linux, Apple Mac and Solaris.

This gives endless opportunities to control a large variety of operating systems for your business or personal day to day tasks.

SilentBytes comes with a huge arsenal of features which can be found directly on the sellers thread.

JCrypter JCrypter is a simple java crypting tool which enables you to encrypt .jar files and protect them from other people using reverse engineering

Requirements SilentBytes | JCrypter [Java](#) | [JDK](#)
Licence

Getting Started Creating your account & logging in

Assuming you have already downloaded & extracted your client to a folder launch the .jar file which is called SilentBytes_beta.jar

The next window you will encounter will be the main logging in screen which has News, Login and the Register tab which looks like this.

Spoiler [\(Click to View\)](#)

Next you will need to go to the register tab and create an account and add the key you received when you purchased your licence then press register and it should say registration complete.

If it says invalid key then paste your key into notepad and make sure the clipboard copy does not have any spaces or random letters and numbers.

Now you have successfully created your account and your key is activated you can go ahead and login to your client.

Preparing Your Client

Once you have logged in and the client loads it will look like this.

Spoiler [\(Click to View\)](#)

First you need to start listening to your port so navigate to the network tab on the left of your client and press "Add Port" then insert the port number you have port forwarded like so.

Spoiler [\(Click to View\)](#)

Then click on the port you just added and press the "Listen" button which is next to the "Add Port" button.

Creating Your Stub

Now you are ready to create your stub so click the builder tab which can be found on the left panel below the network button and reach this interface.

Spoiler ([Click to View](#))

Fill in the boxes based on what you have done before hand so if your using duckdns put your dns info in the dns box for example example.duckdns.org and the port you are listening to.

Now just work your way through the tabs and pick what ever options you want but remember if you intend on crypting your stub don't pick options that are on the crypter otherwise you will corrupt your stub.

Play around with your stub because the more options you use the more chance it will trigger detections.

Spoiler ([Click to View](#))

Spoiler ([Click to View](#))

Now all that is left is to click the "I accept the TOS" box at the bottom right of your screen then press build and save it to a location of your choosing.

Spoiler ([Click to View](#))

Once it has built another popup will appear giving you the option to bind it to another program or add a maximum file size.

Spoiler ([Click to View](#))

JCrypter

Open JCryptr and register exactly the same way as you do with SilentBytes

JCrypter is really easy all you do is input your .jar file

Select all of the options

Pick the client type so "SilentBytes Product, JRat or Custom.

Go back up and press generate key

Press Run and it will crypt it to the folder where JCrypter is located and calls it encrypted so just rename to what you want. Spoiler ([Click to View](#))

Common Questions:

Q: What programming language is Silentbytes coded in?

A: It is programmed in Java.

Q: What is the best crypter for SilentBytes?

A: JCrypter since its managed by the same seller.

No problem I enjoy helping others and this is really simple anyway but even if it helps 1 person It was worth the time ?

Updated thread to combine JCrypter since it didn't make sense making a new thread.

TOM - May 19, 2017, 9:17 pm

uh what more do you need? ur ports open now put that shit into the builder and build ur stub lol

pokego709 - May 20, 2017, 11:13 am

Very nice tutorial! Glad to see community support for these programs. Has anyone had success with a mac victim?

Quote:mac victim?

Victim ??? ? ?

I suggest you to , read the product software agreement and terms of the silentbytes . if you were trying to use SB on computers you don't have access or permission .

VirtualMon3y - May 21, 2017, 9:08 am

Nice tutorial Op. Took some time and effort to put that together.

RAT Support - May 21, 2017, 3:51 pm

(May 21, 2017 09:08 AM)UKninja Wrote: [\[CITE\]](#) Nice tutorial Op. Took some time and effort to put that together.

Thanks :)

When I do guides for things I enjoy I tend to go a bit OCD and it kinda took me 4 rewrites & 4 hours to create to this point and every day Im editing it or adding xD

Got the standard easy port forwarding guide to go yet & DNS setup.

?

Well that is your opinion but at the same time this product does not allow the use of it illegally otherwise people lose their licence if caught.

Imlerith - May 22, 2017, 7:51 am

does jcrypter make it fud runtime ??

RAT Support - May 24, 2017, 11:48 am

(May 22, 2017 07:51 AM)Imlerith Wrote: [\[CITE\]](#) does jcrypter make it fud runtime ??

I still need to check that but have not had the time.

What I will say is don't expect it since no HF crypter is FUD runtime from my experience and feedback from other users.

moufmouf - May 29, 2017, 10:54 am

i test it but after i restart the windows machine it wont show up like if startup option it not working

RAT Support - May 29, 2017, 5:15 pm

(May 29, 2017 10:54 AM)moufmouf Wrote: [\[CITE\]](#) i test it but after i restart the windows machine it wont show up like if startup option it not working

Make a blank clean stub with just your dns info and startup then run on your own pc then restart your pc.

If still doesn't work report it to the seller Tom Cruise.

moufmouf - May 30, 2017, 10:08 am

nicobastos - September 16, 2017, 9:45 am

I buy this product one week ago its look pretty cool but I don't know why i have this problems on my machine.

first of all the port is ok, everything is ok on canyouseeme.org when i put the port, i builded the file pure without modification, i have java in the machine but when i execute the file i can't see victims on the panel and now after update i cannot build any server

<https://imgur.com/aU608T7>

I wait for answers Im wanted to use this beautiful rat...
