Thread: ['Sentry MBA' config for Deviantart](#)

s0ldi3r - June 4, 2017, 11:19 pm

Hello,

I am trying to brute force a Deviantart account using Sentry MBA, but I get "404 - SSL handshake failed" error when I click on the 'analyze' button in the 'header' section. ??? I'd really appreciate it if somebody makes a config file for DA's Login page below:

deviantart.com/users/login

Thanks.

Last time I checked deviantart has an account lockout policy so even if you managed to make one you wouldn't get far unless of course your just using sentry to run password lists obtained from other sources/combo lists then it will work find on deviantart since it trys a different username and pass each time.

Thank you for replying. I'm fine with combo lists but the problem is that I can't get my sentry MBA config done because I get "SSL handshake error" in the "HTTP header" section in Sentry MBA. I even used Fiddlers to bypass the error but it didn't help. Could you please check if you can make the config file for DA in sentry MBA?

BTW, sorry for my bad English..I'm not a native English speaker.

get live http headers for firefox replay the login post request and copy the data into sentry MBA, never made a config before cause I don't use combo lists but that should be able to help you out, I always use live http headers for other things. EDIT: Just noticed you mentioned using fiddler basically the same thing did you put in the right parameters and everything?

I'm going to try it. Thanks a lot.
