Thread: [\[Custom Network-Identity.cmd\] - name says it all](#)

ImDeepWithWindows - June 22, 2017, 9:47 am

lets you set custom network DNS-Name and IP-Address (spcifically the IPv4 address the only one anyone even cares about or even uses at all) for your computer

tell me what changes u wanna see if any, i made this cuz i was bored and kinda half assed it anyway

the code in the script trigger's hackforums anti-codeinjection blocker
so i posted it [here](#)

btw if u dont already know about this:

=====

if u dont know if you set your IPv4 address to something thats out of range of your default gateway you cant bridge threw to the intnernet just local network stuff

what out of range means is lets say your default gateway is 192.168.1.1 then in your computers ip address the first 3sections separated by periods have to match the first 3sections of the default gateway to be in range

--
example of out of range:
default gateway: 192.168.1.1
computer's ip: 69.69.69.69
--

--
example of in range:
default gateway: 192.168.1.1
computer's ip: 192.168.1.69
--

nice

Chan Wong - June 26, 2017, 10:25 am

Can I use this to bypass internet being shut off for all computers after a specific time? (My school blocks access to internet after 11 pm)

ImDeepWithWindows - June 27, 2017, 7:23 pm

(Jun 26, 2017 08:49 AM)LegoStoppro Wrote: [\[CITE\]](#) nice thanks

i doubt this is how their I.T. guy setup having internet access in the network shut off after 11pm, he probably did it at the router

maybe try going to "http://*default-gateway-IPaddress-go-here*" in a web browser to get to the routers control pannel and use a list of default username & passwords from a google search to log in to the control pannel so u can actually see the stuf and look at their setup in there.

its usually something like
"username: administrator password: administrator"
or
"username: teacher password: apple"

is it a college or high school? that kinda makes a difference in what type of security 2 expect
(Jun 26, 2017 08:49 AM)LegoStoppro Wrote: [\[CITE\]](#) nice `if u want we can
just go back and forth about stupid stuff in this thread for a few posts to help u get to your 50th post to change your account status so u can start posting url's and pics with your acccount
