Thread: [Plaintext Passwords on a MyBB forum to .txt file!](#)

SupremeF - June 23, 2017, 1:05 pm

Is there any way to do this please?

vorticalbox - June 23, 2017, 1:43 pm

Mybb will use some sort of hashing to store it's passwords, you could get the hash and try crack them but you'll never get a plain text password.

SupremeF - June 28, 2017, 2:11 am

There must be some other way.

You could use XSS to steal a cookie, or trick a user into putting the login information into a fake website that looks like the forum, target malware to users, create a Python script to try a word list against accounts.

You're not getting plain text passwords from a database.

Tommy Chong - June 28, 2017, 3:43 am

If you actually got access to the files on the webserver (Which means you already hacked it) you could write a piece of code which will put the user:pass to a txt file everytime a user logs in

Drug Problems - June 28, 2017, 3:43 am

If you're admin of the MyBB forum you can remove the encryption if you know the proper coding

If you're trying to hack accounts on a random MyBB forum you'd have to find an exploit in the database (most likely would be encrypted) or infect/trick your target

Done this before, just gotta write a couple lines of PHP to output all user input in the Login page to a txt file or mail. This would only in fact work if you have access to the files.
