Thread: [Question regarding .NET Versions](#)

EPS Tech - June 26, 2017, 6:19 am

There is this little confusion I have regarding what version of .NET comes with a particular version of Windows?

Lets say I have six (6) brand new system and each comes with their separate OS version as below.

Windows xp
Windows 7
Windows 8
Server 2008
Server 2012
Windows 10

What .NET comes pre shipped with each of them?

And more important question below....

If I have .NET 2.0 exe/crypter what is my execution rate on all those 6 systems?

If I have .NET 4.x exe/crypter what are my chances?

Then lastly, why no .NET 3.5 crypter or tools seeing that its preinstalled on almost all I guess or am wrong...? ?

i dont fully know this myself, but as for the execution rate on .net 2.0, iv seen about 80% - 90% execution rate if u target randomly, and a 90%+ if u target newer ones such as win8 and win10, this is from personal experience. but someone correct me if im wrong

I tried to get him to elaborate on this claim but no answer from him on that.

But I think .NET 2.0 is pretty more on systems than .net 4.x, I might be wrong though.

thats the shittiest claim iv ever heard a crypter owner make... 2.0 is on 90%+ of modern windows OS's.. there is plenty of proof, while 4.0 is only on 50% - 60%
