Thread: [AJAX \(HTTP\\_X\\_REQUESTED\\_WITH\) not working on apache2 \(debian\)](#)

Exeption™ - July 4, 2017, 4:38 am

Hey HF ?

Im trying to get this code working to load sub pages, but since i changed my server to linux, its not working anymore.

Code:

PHP Code

```
<?php
if(isset($_SERVER['HTTP_X_REQUESTED_WITH']) && !empty($_SERVER[
'HTTP_X_REQUESTED_WITH']) && strtolower($_SERVER['HTTP_X_REQUESTED_WITH']) ==
'xmlhttprequest')
{
    if(!isset($_GET['page'])){
        include('pages/index.php');
    }else{

        switch($_GET['page'])){

            case 'index':
                include('pages/index.php');
                break;
            case 'settings':
                include('pages/settings.php');
                break;
            case 'profile':
                include('pages/profile.php');
                break;
            case 'terms':
                include('pages/terms.php');
                break;
            case 'history':
                include('pages/connections.php');
                break;
            default:
                include('pages/index.php');
        }
    }
    exit;
}
?>
```

Greetings.

Did you install PHP correctly(try to run phpinfo())? Do you have any logs in

apache(/var/log/apache2/error.log)? Did you set proper rights to folder/files?

**SIM-2223238** - July 4, 2017, 7:12 am

What's the actual error? What do you mean its not working anymore.

"Did you set proper rights to folder/files?"

I pointed my domain to the folder with the web files.

But..not more.

That's not what I meant, I mean the permissions of the files, you are able to see the phpinfo page from the domain?

Try also using `$_SERVER['DOCUMENT_ROOT'].'/pages/page.php'` in include

**Exeption™** - July 4, 2017, 7:39 am

"you are able to see the phpinfo page from the domain?"

Yes, it is.

"Try also using `$_SERVER['DOCUMENT_ROOT'].'/pages/page.php'` in include"

EDIT:

Not working too. ^^

Can you show me your current code? Also add `error_reporting(E_ALL)` and tell me about the apache logs

Thanks for your help mate.

Im switching now back to a Windows server ?

the apache logs did showed that the file could not found on the server.  
(domain.com/index as example)

Have a nice day,

Im quitting linux again lol. -.-
