Thread: [FULL LIVE STREAM - Flexbox website, Start to Finish!](#)

Ampix0 - July 12, 2017, 10:49 am

Hey guys! My next video will be a clean and polished tutorial on how to build a website with flexbox, but before I make that video, I had to code the site once first.

So I decided to live stream the whole process from start to finish. In one sitting, learn how to convert a photoshop mock-up into a full Flexbox website.

I've been thinking about using restream.io to reach more people. Looks like this website uses Twitch? So I'll have to try to go to both.

Good job dude!

If I could +rep you I would :)

Btw, to abide by HTML 5 practice, instead of using placeholders in your form for inputs like email where the user may mistakenly forget they've filled out the form or assumed it's already filled out for them, use a form-group to group the elements and then use labels for the inputs. Perhaps a red asterisk next to required inputs labels, and use the 'required' attribute before you close the input element (without the quotation marks) to take advantage of modern browsers built-in JS warnings.
