ANDROID HACKING WITH METASPLOIT IN KALI

As we generate a .apk file and send it to the victim's mobile it will be connected till the session is on

how to store that apk file inside the sdcard ?? and

what should we do for all-time connectivity with their mobiles...that whenever we start the session and if he is in the same network we could be able to connect to that device?????

is there any one who has the answer

SysAdmin - July 14, 2017, 3:14 am

What do you mean? Most Android RAT's need Root access to do anything major anyway.

Mr. Robot - July 14, 2017, 3:16 am

There are other ways of exploiting android phones than having them install an apk.

Abducted - July 14, 2017, 3:17 am

Exploiting Android devices newer than 5.0 (aka no longer dalvik) using Metasploit Framework is no longer possible - there are simply no payloads for the ART arch.

Cheers,
Abducted
