Thread: [hydra http-post-form bruteforce attack](#)

foreign84 - July 15, 2017, 3:51 am

hi

how can I attack to a wordpress site with using hydra http-post-form bruteforce attack ?

Mr. Robot - July 15, 2017, 3:53 am

If you are just attacking a wordpress site you shouldn't need to use hydra, there is a metasploit module for it.

Link the site you are trying to attack.

Make sure you have also done both a spider of the site using something like ZAP as well as running wpscan

What? Please post the site you are trying to attack. If you merely want to attack it you don't need to reinvent the wheel for a wordlist attack.

AS far as using hydra is concerned, read the --help and you wont have any issues. It's self explanatory.

When using wpscan please use --enumerate -u to get a list of valid usernames for the site, then use a password list against those.

Example:

Code wpscan -u www.jaimedicalsystems.com --enumerate u

To run a dictionary attack against those users you would then do the following

Code wpscan --url www.jaimedicalsystems.com --wordlist rockyou.txt --username rdevlin --threads 4

Obviously replacing the website with the target, wordlist with your password file, username (rdevlin)

to one you enumerate and then threads.

thanks but I know how using wpscan.

```
target.com/wp.login.php
username:admin
```

```
hydra target.com -l admin -P /root/Desktop/password.txt http-post-form
"/wp-login.php:log=^USER^&pwd=^PASS^&wp-submit=Log In:Error" -vV
```

result: hydra is finding too much true login result for that attack

I see a few things that might be an issue, why not try the method I posted above. You will get better results.
