Thread: [Build exe with another exe on a non python machine](#)

TheWarOwl - July 18, 2017, 12:24 pm

Just a quick question. I know how to "freeze" my code into an executable with python but I was wondering how I can create an executable that can be used to create other executables... on a machine say that doesn't have python installed.

A lot like RAT's here on HF do. Is this possible? I don't really need a step by step guide, anything that will point me in the right direction would be nice.

EDIT: I might have come up with a solution using py2exe / pyinstaller.exe. I'll post back if I can get it working, in the mean time feel free to answer if you know.

Haha xD I'm not against the idea, I just thought this would be cool if it's possible in python.

Python is using transparent compile system never will be used for "real-world" malwares.
