Thread: [Microphone PINs look broken](#)

RandomUser123 - July 19, 2017, 5:34 pm

Hello, my msi ge62 7re apache pro has 2 jack inputs: a mic one and an headphone one.

Today i put my headphone's jack in the mic one for it's first time, and i didn't feel the click it should do.

So i took a flash and looked into the door, and i saw this: (headphone on the left and mic on the right)

Is it ok for the pin to be like this? What shall I do? Should I try to get it back myself? PC has warranty (it's very new), it would just upset me a little bit to get it replaced and reinstall everything, even tho i risk it to make a short-circuit if the pins moves and touches the others..

Help me

EliteTM - July 20, 2017, 1:31 am

Does the fallen pin move or is it stuck? I'd try to take the tiny pin out and then plug in a microphone to see if it works. However, I always thought the microphone jack and headphone jack basically used the same connector length and diameter.

I thought the same. The point i still have warranty on this very new pc. Moving myself the pin may make it break..
